**can\_has\_stdio?**

通过brainfuck在线工具打开即可

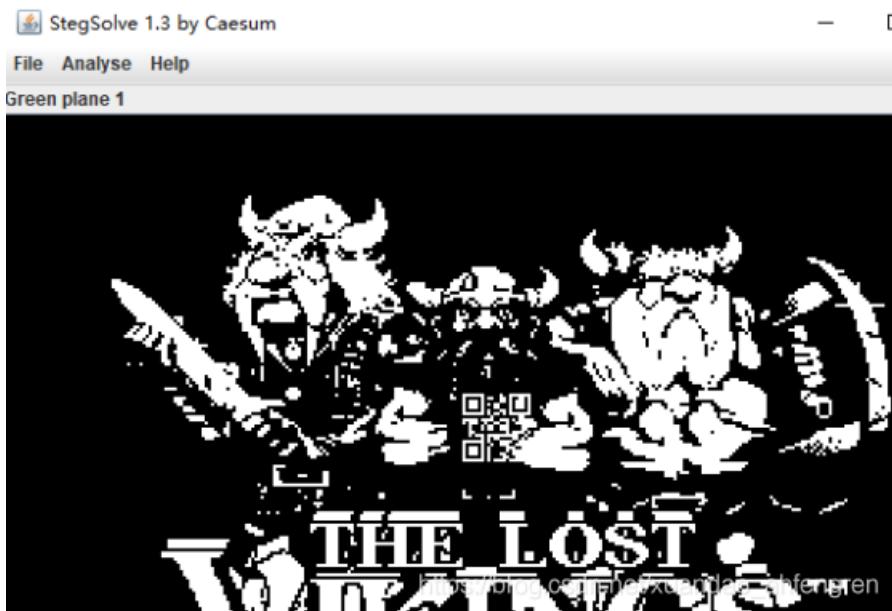

<http://esoteric.sange.fi/brainfuck/impl/interp/i.html>

Erik-Baleog-and-Olaf

file发现是png格式，根据图片名字联想到使用Stegsolve工具

```
root@kali:~# file stego100
stego100: PNG image data, 640 x 480, 8-bit/color RGB, non-interlaced
root@kali:~#
```

使用ps进行补全，扫描二维码得到flag

flag{#justdiffit}

**hit-the-core**

然后我们发现大写的XCTF每个字母之间只隔了四个字母，使用python提取一下，得到flag。

```
num='cvqAeqacLtqazEigwiXobxrCrtuiTzahfFreqc{bnjrKwgk83kgd43j85ePgb_e_rwqr7fvbmHjklo3tews_hmkogoooyf0vbnk0ii8
flag = ''
for i in range(3,len(num),5):
    flag += num[i]
print(flag)
```

74 1.py - C:\Users\19154\Desktop\1.py

File Edit Format Run Options Windows Help

```
num='cvqAeqacLtqazEigwiXobxrCrtuiTzahfFreqc{bnjrKwgk83kgd43j85ePgb_e_rwqr7fvbmHjklo3tews_hmkogoooyf0vbnk0ii8
flag = ''
for i in range(3,len(num),5):
    flag += num[i]
print(flag)
```

74 Python 2.7.6 Shell

File Edit Shell Debug Optic

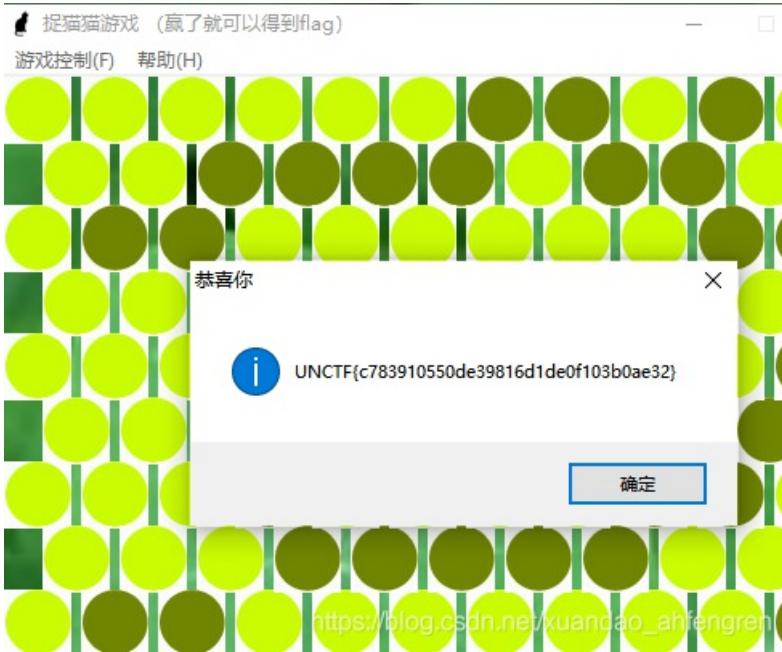

```
Python 2.7.6 (default, Nov 30 2013, 00:00:00)
[PyPy 2.4.0 | built on Nov 30 2013 00:00:00 UTC | Last updated: Sat Dec  7 00:00:00 UTC 2013]

## 快乐游戏题

直接通关就可以了

提示：flag是固定的可以直接提交，UNCTF{c783910550de39816d1de0f103b0ae32}

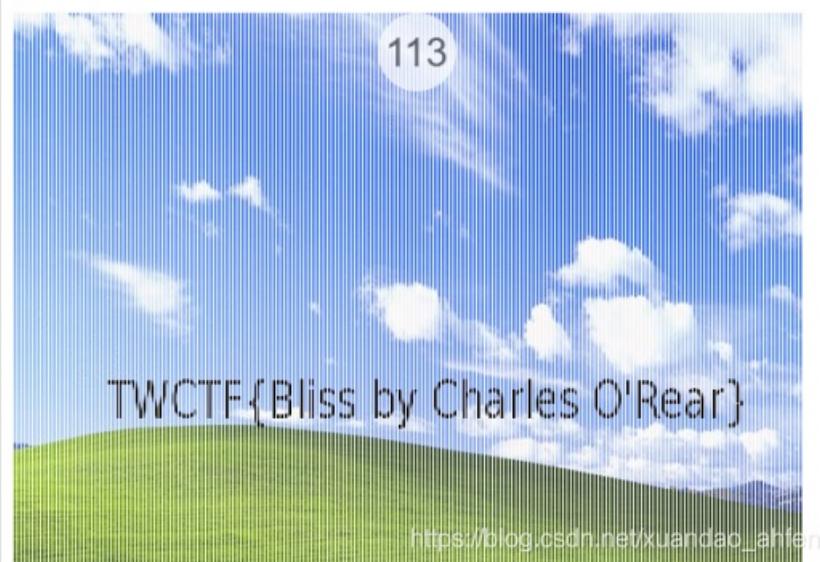

## glance-50

用在线网站直接拼接

<https://tu.sioe.cn/gj/fenjie/>

浏览... 1.gif

TWCTF{Bliss by Charles O'Rear}

#### 4-1

先用010editor编辑图片，发现txt文件，直接把后缀修改成zip把文件压缩出来

```

1 4B CD 04 54 31 27 D3 .fÍ.Ul'Ó.Kí.Tl'Ó
1 50 4B 01 02 3F 00 14 .Kí.Tl'Ó.PK..?...

```

解压后txt中提示flag在day2.png中，猜想是盲水印

##### 安装环境

```

sudo pip install matplotlib
pip install opencv-python

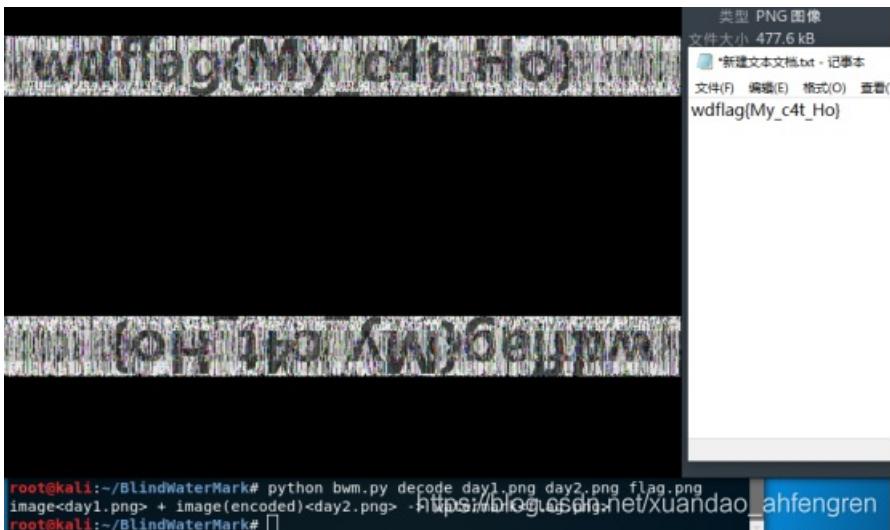

```

##### 然后安装解密脚本

```
git clone https://github.com/chishaxie/BlindWaterMark
```

##### 解密操作：

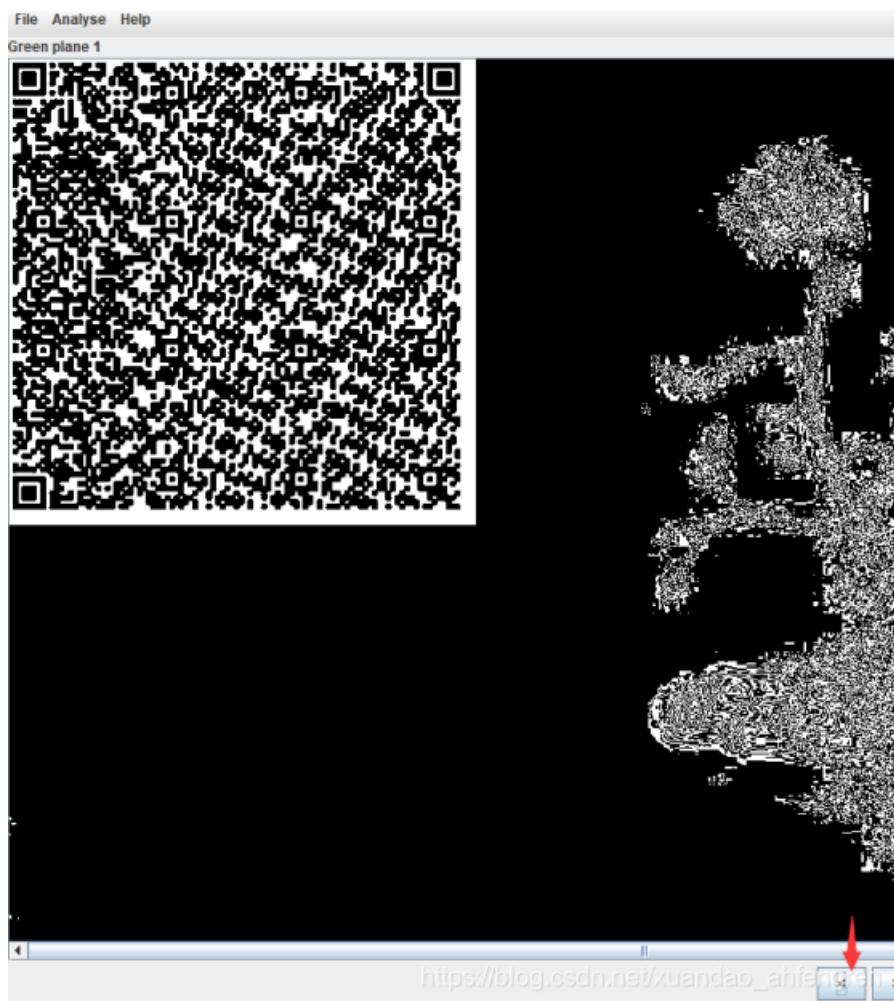

```
python bwm.py decode day1.png day2.png flag.png
```

适合作为桌面

用Stegsolve打开左右调节即可出现二维码

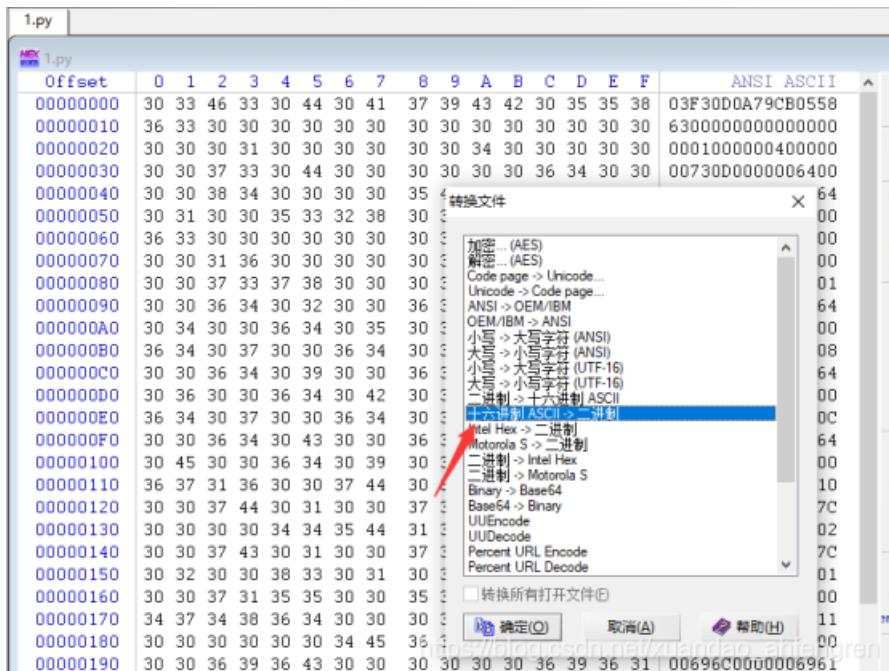

再放在QR上面扫描二维码出现疑似十六进制的内容

內容

我们放在winhex里面，按Ctrl+r，转换成二进制，然后保存为1.pyc进行反编译python文件

请选择pyc文件进行解密。支持所有Pyt

浏览... 未选择文件。

```
1 #!/usr/bin/env python
2 # encoding: utf-8
3 # 如果觉得不错，可以推荐给你的好友
4
5 def flag():
6     str = [
7         102,
8         108,
9         97,
10        103,
11        123,
12        51,
13        56,
14        97.
```

加多一个flag()即可运行得到flag

The screenshot shows a Windows desktop environment. On the left, there is a code editor window titled "1.py - C:\Users\19154\Desktop\1.py". The code in the editor is:

```
def flag():
    str = [
        102,
        108,
        97,
        103,
        123,
        51,
        56,
        97,
        53,
        55,
        48,
        51,
        50,
        48,
        56,
        53,
        52,
        52,
        49,
        101,
        55,
        55,
        125]
    flag = ''
    for i in str:
        flag += chr(i)
    print flag
flag()
```

A red arrow points to the line "print flag". On the right, there is a terminal window titled "Python 2.7.6 Shell". The terminal output is:

```
Python 2.7.6 (default, Nov 10 2013, 32 bit)
Type "copyright", "credits" or "version"
>>> =====
>>> flag(38a57032085441e7)
>>>
```

Below the terminal window, the URL [https://blog.csdn.net/xuandao\\_ahfengren](https://blog.csdn.net/xuandao_ahfengren) is visible.

心仪的公司

在tcp流中发现fl4g

Frame (639 bytes) Reassembled TCP (6365 bytes)

## stage1

放进Stegsolve里左右调整

保存再放在RQ分析二维码，然后放进winhex转换为二进制，保存为pyc进行反编译python文件后运行即可

版本: 18  
纠错等级:L, 掩码:3  
内容:

```
File Edit Format Run Options Windows
def flag():
    str = [
        65,
        108,
        112,
        104,
        97,
        76,
        97,
        98]
    flag = ''
    for i in str:
        flag += chr(i)

    print flag
flag()

```

## EasyCap

打开数据包，追踪tcp流即可

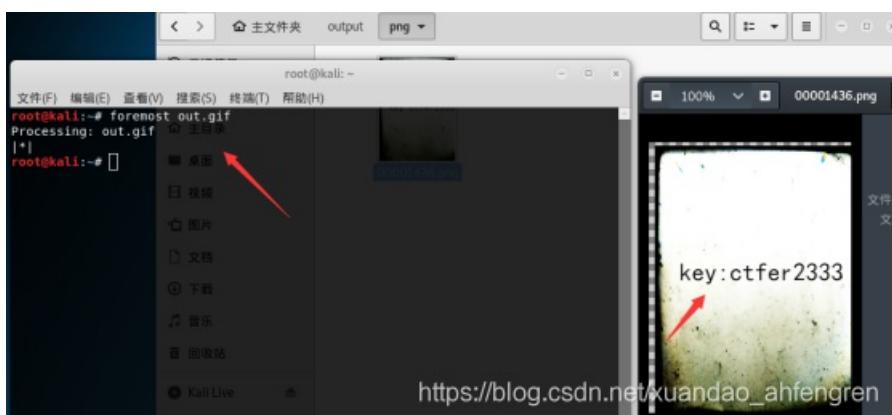

[https://blog.csdn.net/xuandao\\_ahfengren](https://blog.csdn.net/xuandao_ahfengren)

## 双色块

binwalk分析发现尾部有png，用foremost分离出来

拿出来是□个密码

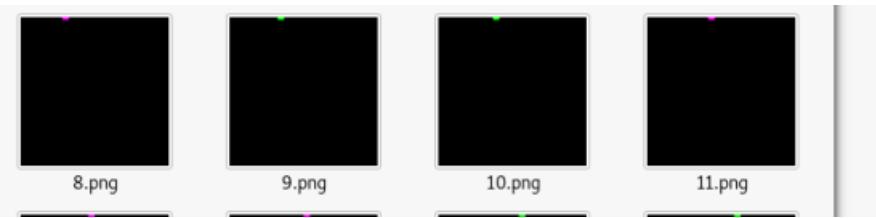

gif轮播之后发现是□个2424的像素点，每个像素为1010，每个点颜□为00ff00或是ff00ff 先把gif分离成单帧

```
#!/usr/bin/env python2
# -*- coding: utf-8 -*-

import os
from PIL import Image

def main(gif_file):
    png_dir = 'frame/'
    img = Image.open(gif_file)
    while True:
        current = img.tell()
        img.save(png_dir + str(current + 1) + '.png')
        img.seek(current + 1)
    if __name__ == '__main__':
        gif_file = 'out.gif'
    main(gif_file)
```

会出先很多图片

然后读取每个png中的对应点的信息，并按照8bit转换为ascii

```
#!/usr/bin/env python2
# -*- coding: utf-8 -*-

import os
from PIL import Image

def main():
    png_dir = 'frame/'
    ret = ""
    for i in range(0,24):
        line = ""
        for j in range(0,24):
            file_name = "frame/" + str(i * 24 + j + 1) + ".png"
            x = j * 10 + 5
            y = i * 10 + 5
            img = Image.open(file_name)
            img = img.convert("RGB")
            img_array = img.load()
            r, g, b = p = img_array[x, y]
            if g == 255:
                line += "0"
            if r == 255 and b == 255:
                line += "1"
            if len(line) == 8:
                ret += chr(int(line, 2))
                line = ""
    print ret
if __name__ == '__main__':
    main()
```

两个等会后面的hh去除了然后进DES解密即可得到flag

```
root@kali:~# python 1.py      8.png      10.png      11.png
o8DlxK+H8wsixE/ERFpAMaBPiIcjlsHyGOMmQDkK+uXsVZgre5DSXw==hhhhhhhhhhhhhhhh
```

加密

DES加密模式: ECB 填充: zeropadding 密码: cfer2333 偏移量: iv偏移量, ecb模

待加密、解密的文本:  o8DlxK+H3wsiXe/ERFpAMaEPiIcjlsHyGOMnQDkK+uXsVZgre5DSKw==

↑ 将你电脑文件直接拖入试试^\_^

DES加密 DES解

DES加密、解密转换结果(base64了):  flag{2ce3b416457d4380dc9a6149858f71db}

[https://blog.csdn.net/xuandao\\_ahfengren](https://blog.csdn.net/xuandao_ahfengren)

## 很普通的数独

将有数字的格子写成0，没有的写成1

```

100110100010000110111111101100101110111110011  
00000000111111010110100010101110010001000110  
11111110001111101101101011011110011101011110  
1000001011110101101000111110010001100010001  
101110101011110000111111101101001000111111011  
1011101000110111101101000001001101100011101101  
10111010000011101100001101010110010010010001  
100000101011001011111011001011000011010110000  
1111111010101001111011110101101110000101101
```

然后使用python写个脚本来生成图片。

```

from PIL import Image
x = 45
y = 45
im = Image.new('RGB', (x, y))
white = (255, 255, 255)
black = (0, 0, 0)
with open('ss.txt') as f:
    for i in range(x):
        ff = f.readline()
        for j in range(y):
            if ff[j] == '1':
                im.putpixel((i, j), black)
            else:
                im.putpixel((i, j), white)
im.show()

```

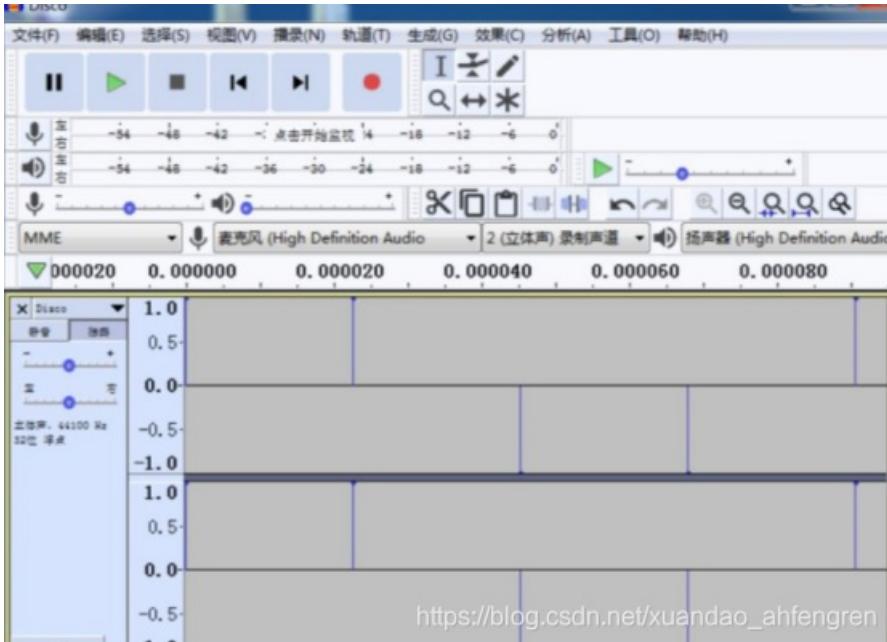

扫出来是：

Vm0xd1NtUXIWa1pPVldoVFIUSINjRIJ\WGToamJGWnIWMjFHMUxV1ZqTldNakZIWVcxS1IxTnNhRmhoTVZwe\

是多个base64加密的，解密出来是flag{y0ud1any1s1}

## 很普通的Disco

峰值高的点为1，峰值低的点为0。抠出来，是105个二进制数，每7个数为一组，刚好15组，也就是15个字母，最后用python跑出来即可

https://blog.csdn.net/xuandao\_ahfengren

```

Python 2.7.6 Shell

    j+=chr(int(g,2))
print(j)

```

flag{WOW\*funny}

就在其中

打开数据包发现，找到了key

还有一些文件，果断用foremost分离出来

```
Line-based text data (15 lines)
-----BEGIN RSA PRIVATE KEY-----
MIICXgIBAAKBgQD0UN0A+70iM0VCJ1n1o/n/U1BRj0u8yMWh4Qi+xTbjHgbE7w0uk\n

```

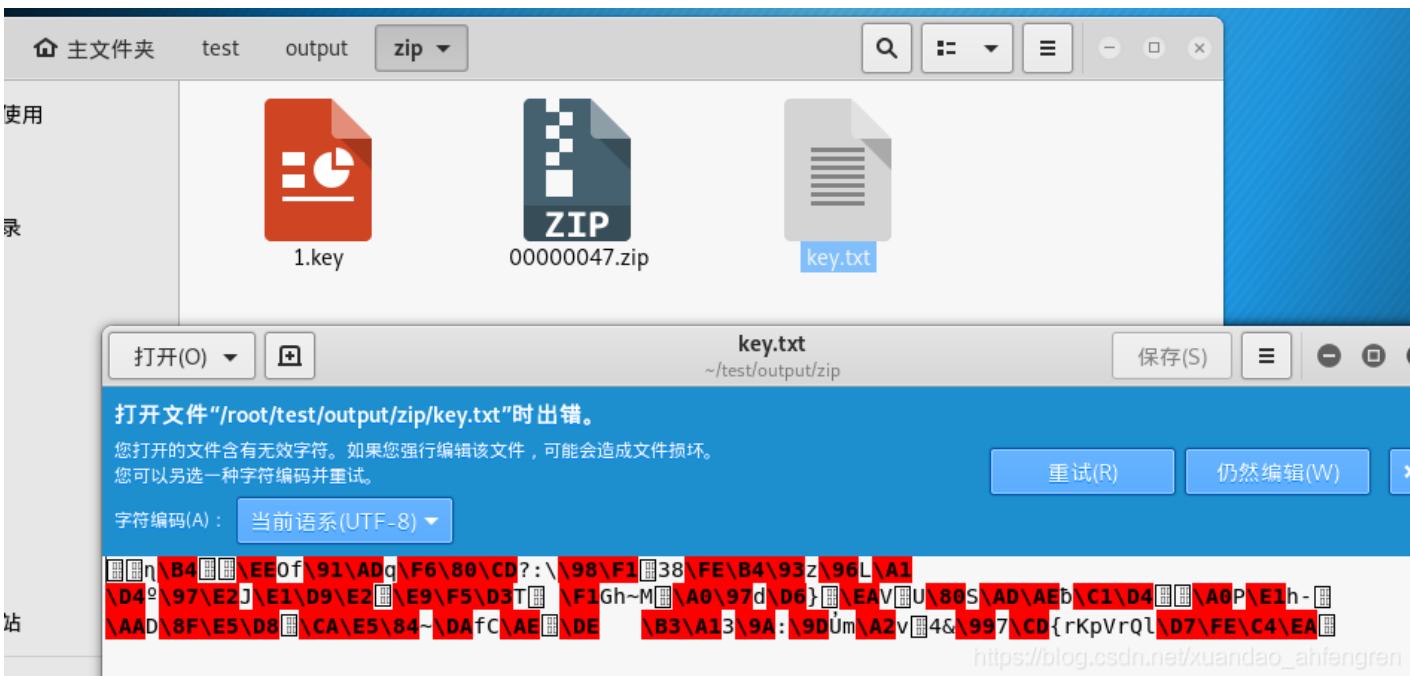

s)

142588562 IDA Pro 6.5 Setup.exe\r\n

128 key.txt\r\n

20 20 31 31 3a 31 35 41	08-09-16 11:15A
20 20 20 20 20 20 20	M
65 79 2e 74 78 74 0d 0a	128 key.txt..
20 20 31 31 3a 32 39 41	08-10-16 11:29A

有个压缩包，里面的key.txt文件被加密过了，我们有密码就可以直接解密

openssl rsautl -decrypt -in key.txt -inkey 1.key -out flag.txt

in为要解密的加密文档-inkey为密钥-out为输出文档

```
hi, boys and girls! flag is {haPPy_Use_OpenSsI}
```

再见李华

用winhex打开看到key.txt，把后缀改成zip

```
14 00 01 | I- I\»1yUPK  
00 00 1A | ii I q %  
74 1F B8 | key.txt ,  
3F 7C C2 | mFF D 5 14A0F11A
```

打开需要密码。

没有特殊字符，是指密码中没有特殊字符。而不少于1000个字，这个1000是8的二进制，所以密码是9位或9位以上，最后署名，意思是密码中后面5位数是Lihua，最后用Advanced ZIP Password Recovery\_4.0进行破解。最后密码为15CCLiHua

```
import string  
from hashlib import md5  
a = string.ascii_letters + string.digits  
  
for a1 in a:  
    for a2 in a:  
        for a3 in a:  
            for a4 in a:  
                if '1a4fb3fb5ee' in md5(bytes(a1 + a2 + a3 + a4 + 'LiHua').encode('ascii')).hexdigest():  
                    print a1+ a2 + a3 + a4 + 'LiHua'  
                    break
```

---

```
port string  
om hashlib import md5  
= string.ascii_letters + string.digits  
  
r al in a:  
    for a2 in a:  
        for a3 in a:  
            for a4 in a:  
                if '1a4fb3fb5ee' in md5(bytes(al + a2 + a3 + a4 + 'LiHua').  
                    print al+ a2 + a3 + a4 + 'LiHua'  
                    break
```

74 Python 2.7.6 Shell

```
File Edit Shell Debug Options Windows Help

肥宅快乐题

打通关后获取base64加密后的flag，解密即可

## warmup

先将 open\_forum.png 压缩为 open\_forum.zip, 然后明文破解

python bwm.py encode fuli.png fuli2.png res.png

[https://blog.csdn.net/xuandao\\_ahfengren](https://blog.csdn.net/xuandao_ahfengren)

flag{bWm\_Are\_W0nderfu1}
